

Features

- Wide supply voltage operating range: 1.8 to 15 V
- Low current consumption: Typically 5.5 mA in operation, 1 μ A or less in stand-by
- High speed operation is possible: Maximum 1 MHz
- The error amplifier gain is set inside the IC, so peripheral components are minimized.
- Incorporates a soft start circuit.
- Incorporates a timer-latch type short circuit detection circuit (SCP).
- Totem-pole type output with adjustable on/off current (for NPN transistors)
- Incorporates a stand-by function.

Applications

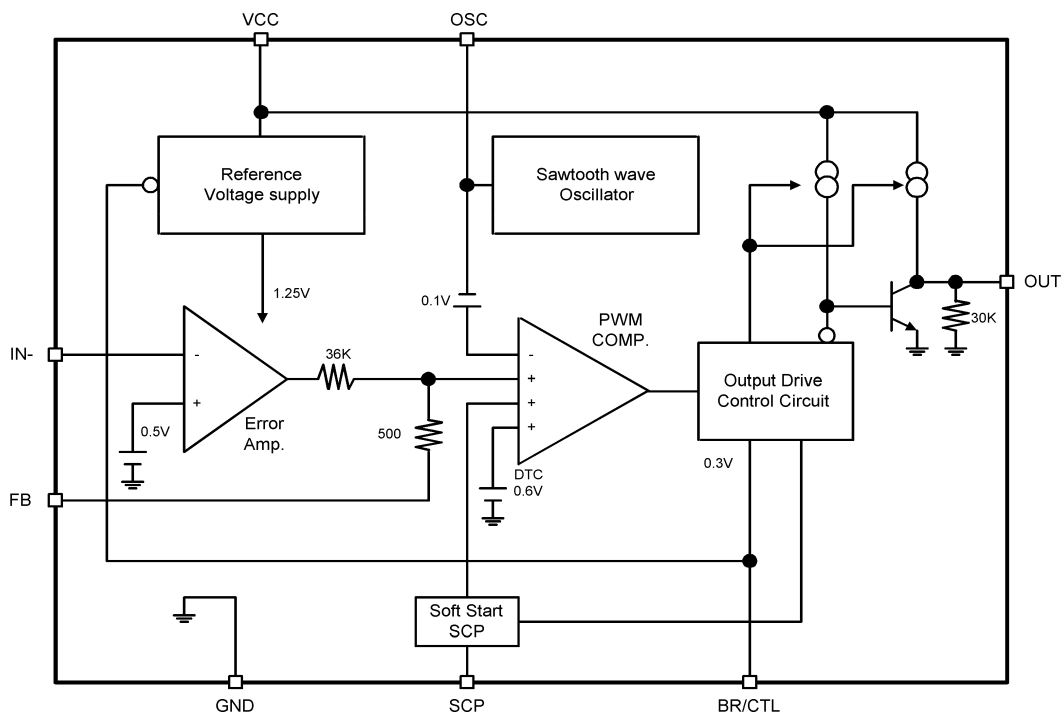

- Power source for battery-powered equipment
- Power source for cameras, camcorders, VCRs, PDAs, electronic data banks, and hand-held Communication equipment

General Description

The AT1380 is a single-channel switching regulator control IC for low voltage applications incorporating a soft start function and short circuit detection function. The device has a low minimum operating voltage of 1.8 V and is ideal for the power supply of battery-operated electronic equipment.

The AT1380 can be operated on two types: non-insulated input/output choppers (step-up, step-down and inverter regulators), and insulated input/output converters (fly-back). The former type is used for DC/DC converters and the latter type is used for DC/DC converts and line-operation-type power supplies.

Block Diagram

Pin Configuration

AT1380 (8-Pin SOIC)

Pin Description

Pin No.	Symbol	I/O	Description
1	IN-	I	Error amplifier inverting input pin
2	SCP	—	Soft start and SCP setting capacitor connection pin
3	VCC	—	Power supply pin
4	BR/CTL	I	Output current setting and control pin
5	OUT	O	Totem-pole type output pin
6	GND	—	Ground pin
7	OSC	—	Capacitor and resistor connection pin for setting the oscillation frequency
8	FB	O	Error amplifier output pin

Absolute Maximum Ratings

(T_a=+25°C)

Parameter	Symbol	Condition	Rated Value		Unit
			Min.	Max.	
Power supply voltage	V _{CC}	—	—	16	V
Output source current	I _O ⁺	—	—	-50	mA
Output sink current	I _O ⁻	—	—	50	mA
Allowable dissipation	P _D	SOP-8, T _a ≤ +25°C	—	430	mW
Operating temperature	T _{OP}	—	0	+75	°C
Storage temperature	T _{stg}	—	-55	+125	°C

* : When mounted on a 10 cm square double-sided epoxy board

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

Recommended Operating Conditions

(T_a=+25°C)

Parameter	Symbol	Values			Unit
		Min.	Typ.	Max.	
Power supply voltage	V _{CC}	1.8	--	15	V
Error amplifier input voltage	V _I	-0.2	--	1.0	V
BR/CTL pin input voltage	V _{BR}	-0.2	--	V _{CC}	V
Output source current	I _O ⁺	-40	--	--	mA
Output sink current	I _O ⁻	--	--	40	mA
SCP pin capacitance	C _{PE}	--	0.1	--	μF
Phase compensation capacitance	C _P	--	0.1	--	μF
Output current setting resistance	R _B	150	390	5000	Ω
Timing resistance	R _T	1.0	3.0	10.0	kΩ
Timing capacitance	C _T	100	270	10000	pF
Oscillation frequency	f _{OSC}	10	500	1000	kHz
Operating temperature	T _{OP}	-30	+25	+85	°C

WARNING: Recommended operating conditions are normal operating ranges for the semiconductor device. All the device's electrical characteristics are warranted when operated within these ranges. Always use semiconductor devices within the recommended operating conditions. Operation outside these ranges may adversely affect reliability and could result in device failure.

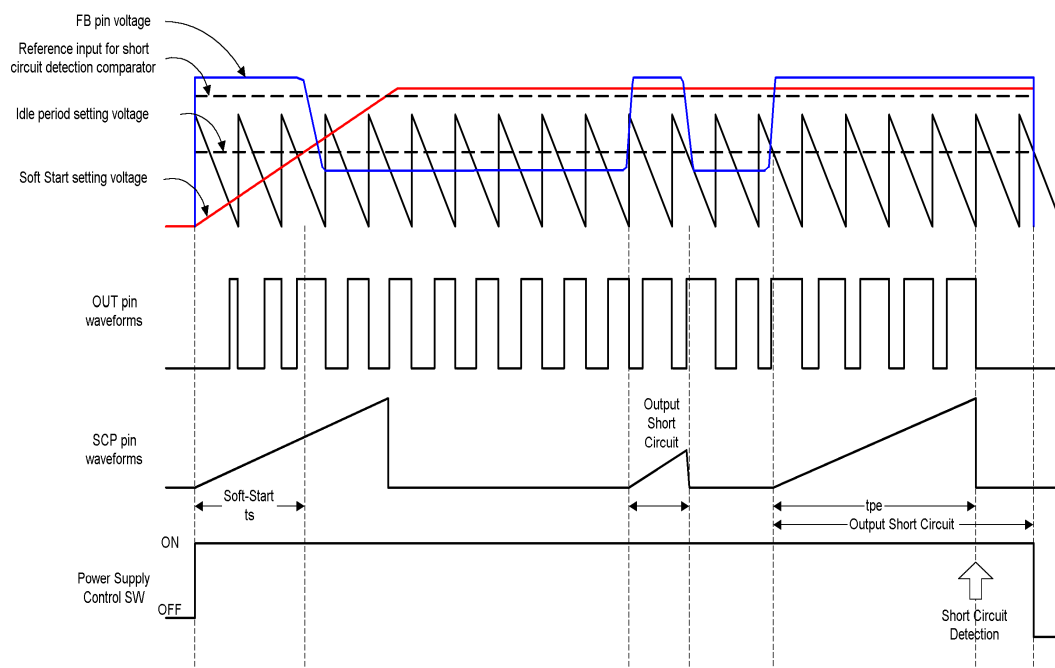

Electrical Characteristics

Functional Description

Soft Start SCP

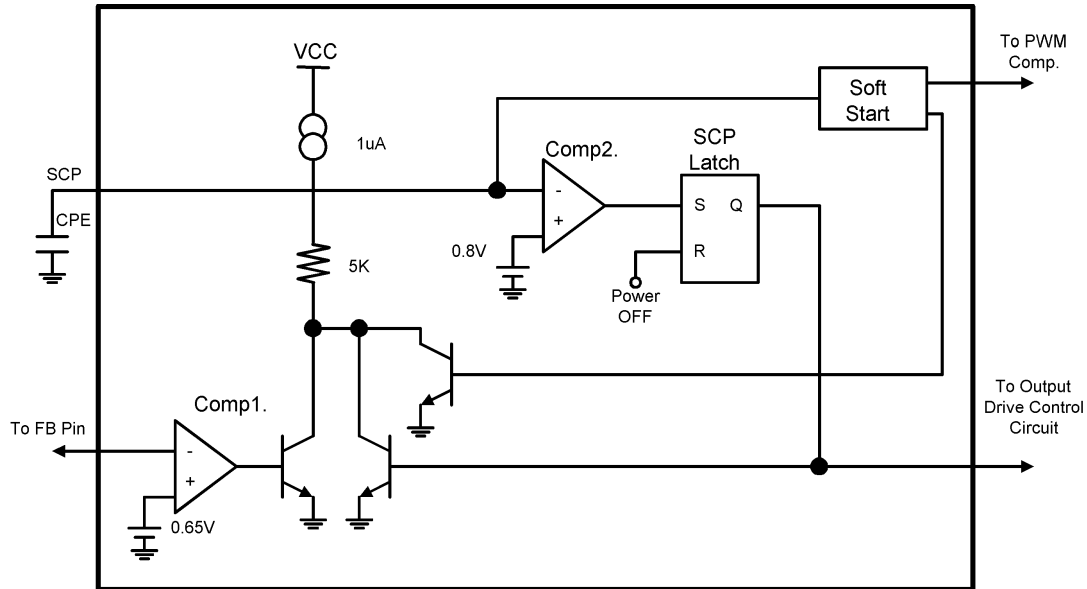

Figure 1 Soft-Start SCP Equivalent circuit

At power-on, the AT1380 operates in the soft-start mode. Since no current is supplied, comp1, comp2, and SCP latch are inactive. Immediately after power-on, the CPE capacitor is charged at a constant current of $1\mu\text{A}$ to increase from 0V. In the soft-start mode, the VSCP (capacitor CPE voltage) is input to the PWM comparator, so that the soft-start circuit is controlled at the on-duty ratio of 0% with the increase of the VSCP.

When the VSCP reaches 0.8V, the soft-start supplies current to comp1, comp2, and SCP latch and at the same time discharges the CPE capacitor ($\text{VSCP}=0\text{V}$). This changes the soft-start mode to the normal mode (output short circuit detection wait state) and the SCP becomes active (stays low). In the normal mode, the input from the soft-start circuit to the PWM comparator is kept at 0.8V.

If the switching regulator output suddenly drops due to load effect, the error amplifier output (FB pin) is fixed at VOM^+ and capacitor CPE starts charging. When the voltage at the SCP pin reaches approximately 0.8V, the output pin is set low and the SCP pin stays low.

Set time by the following expressions (see **Timing Chart**):

Soft-Start time (The time until the output ON duty reaches approximately 50%)

$$t_s = 0.35 \times CPE(\mu F)$$

Short-circuit detection time:

$$t_{PE} = 0.8 \times CPE(\mu F)$$

Setting Oscillating Frequency

The oscillation frequency of a sawtooth waveform is determined by the timing capacitor (CT) and the timing resistor (RT) which are connected to the OSC pin. When the voltage of the OSC pin falls to 0.1V, the CT is rapidly charged to increase the voltage of the OSC pin instantaneously. When the voltage of the OSC pin reaches 0.6V, Charging stops, so that CT and RT are discharged to decrease the voltage of the OSC pin. The waveform of the OSC pin is shown as Figure 2.

Figure 2 Oscillator Waveform

The cycle (T) can be determined as follows:

$$VX = VH e^{-\frac{t}{CT \times RT}} \quad t = -CT \times RT \times \log_e \left(\frac{VX}{VH} \right)$$

$$T = -CT \times RT \times \log_e (0.1 / 0.6) = 1.8 \times CT \times RT [s]$$

Calculating under the conditions of $RT=3.3K\Omega$ and $CT=330pF$, the oscillating frequency is 512kHz, which is slightly different from the value (500kHz) in the **Electrical Characteristics**. This difference is caused by characteristics, such as changes in the maximum voltage amplitude of the sawtooth waveform with the CT value and the circuit delay causing the maximum amplitude to become large in the case of a high oscillating frequency even for the same capacitor. It is difficult to incorporate these non-linear characteristics into the equation. In practical use, therefore, the user should read the RT and

CT values from the characteristic curve or should determine an approximate target value by using the equation.

Switching Regulator Function

(1) Reference voltage circuit

The reference voltage circuit generates a temperature-compensated reference voltage ($\sim 1.25\text{V}$) from voltage supplied from the power supply pin (pin 3). In addition to providing the reference voltage for the switching regulator, the circuit also sets the idle period.

(2) Error amplifier

The error amplifier detects the output voltage of the switching regulator and outputs the PWM control signal. The voltage gain is fixed, and connecting a phase compensation capacitor to the FB pin (pin 8) provides stable phase compensation for the system.

(3) PWM comparator

The voltage comparator has one inverting and three non-inverting inputs. The comparator is a voltage/pulse width converter that controls the ON time of the output pulse depending on the input voltage. The output level is high (H) when the sawtooth wave is lower than the error amplifier output voltage, soft start setting voltage, and idle period setting voltage.

(4) Output circuit

The output circuit has a totem pole type configuration and can drive an external NPN transistor directly. The value of the ON/OFF current can be set by a resistor connected to the BR/CTL pin (pin 4). Stand-by mode (supply current $1\mu\text{A}$ or less) can be set by connecting the BR/CTL pin (pin4) to VCC or by making the pin open circuit.

(5) Under-Voltage Lockout (UVLO)

Transients when powering on or instantaneous glitches in the supply voltage can lead to malfunction of the control IC and cause system damage or failure. The circuit to prevent malfunction at low input voltage detects a low input voltage by comparing the supply voltage to the internal reference voltage. On detection, the circuit fixes the output pin to low.

The system recovers when the supply voltage rises back above the threshold voltage of the malfunction prevention circuit.
