

Description

The ICS502 LOCO™ is the most cost effective way to generate a high quality, high frequency clock output and a reference from a low frequency crystal or clock input. The name LOCO stands for LOw Cost Oscillator, as it is designed to replace crystal oscillators in most electronic systems. Using Phase-Locked-Loop (PLL) techniques, the device uses a standard fundamental mode, inexpensive crystal to produce output clocks up to 160 MHz.

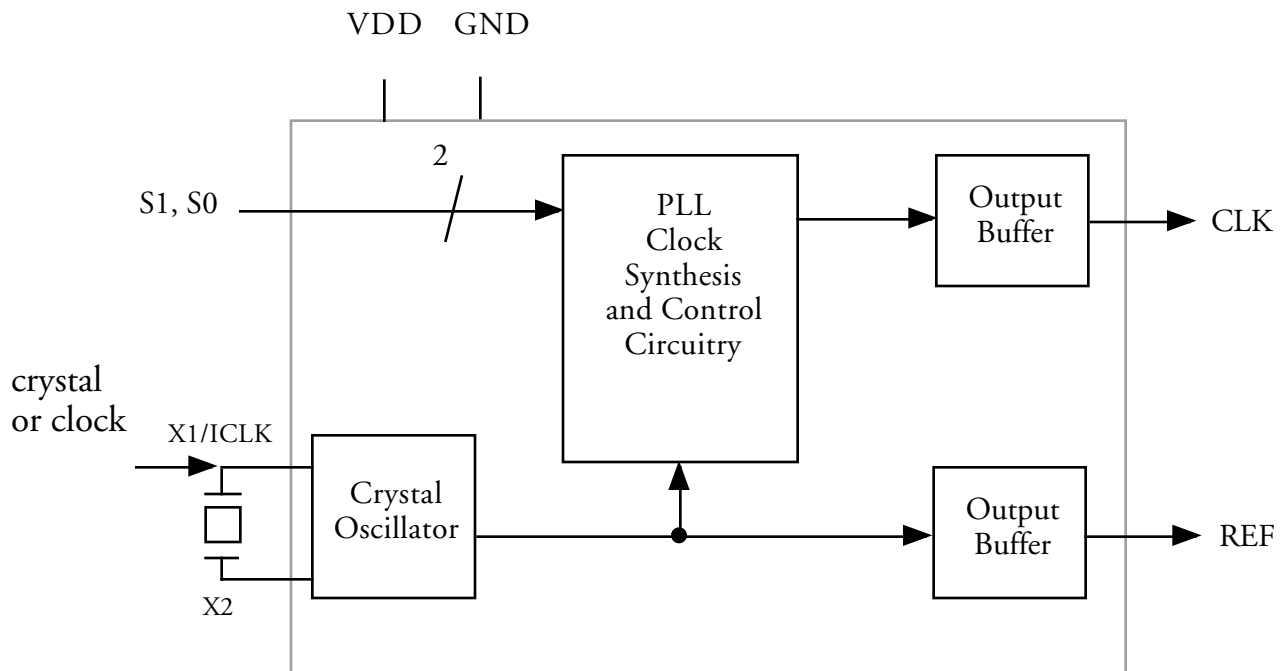

Stored in the chip's ROM is the ability to generate 6 different multiplication factors, allowing one chip to output many common frequencies (see page 2).

External Components / Crystal Selection

The ICS502 requires a 0.01μF decoupling capacitor to be connected between VDD and GND. It must be connected close to the ICS502 to minimize lead inductance. No external power supply filtering is required for this device. A 33Ω terminating resistor can be used next to the CLK pin. The total on-chip capacitance is approximately 13 pF, so a parallel resonant, fundamental mode crystal should be used. For crystals with a specified load capacitance greater than 13 pF, crystal capacitors should be connected from each of the pins X1 and X2 to Ground as shown in the Block Diagram on page 1. The value (in pF) of these crystal caps should be $= (C_L - 13) * 2$, where C_L is the crystal load capacitance in pF. These external capacitors are only required for applications where the exact frequency is critical. For a clock input, connect to X1 and leave X2 unconnected (no capacitors on either).
